

TerraScreen® Interior Greenwall

The most efficient, maintenance friendly live wall system designed for interiors

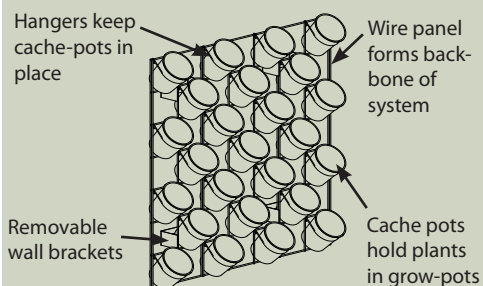

Often described as living art, TerraScreen® allows the designer, landscape contractor, or owner to use “plants as paint” to establish a living, breathing focal point, set a mood, or celebrate a season. TerraScreen® was originally developed by Planterra, a leading interior landscape design and maintenance company, specifically to meet the needs of the hospitality industry. It is the solution to the challenge of installing a living wall that is instantly lush and easy to refresh and maintain.

We recognize that styles change and spaces evolve. TerraScreen® offer more flexibility than any other green wall system; designed so that the planting may be easily updated so the installation is appropriate to the style, season, and environment.

TechnoGym Showroom
New York, NY

- Instantly green - looks great from day one. Designed for use with readily available 6” plants
- The best “intimate” greenwall system - wire panel system disappears behind foliage.
- Available with a pre-plumbed irrigation system, no recirculating water required
- Maintenance friendly - can be maintained by any interior landscape contractor

TerraScreen panels are made of powder-coated galvanized steel wire, with removable brackets to fasten the panel to the wall. Plants are placed in their 6” grow pot directly into the black no-hole cachepot. The hanger system keeps the plants in place. The cache-pot acts as a no-leak saucer. Replacements are simple—just remove the plant from its cachepot, put another in its place.
